Assignment A1b: Functions and Computation

John Mays, jkm100

```
In []: # Appropriate Libraries for the notebook:
    import numpy as np
    import wave
In []: import A1b_code # <---- where all of my functions are written
```

1. Common functions

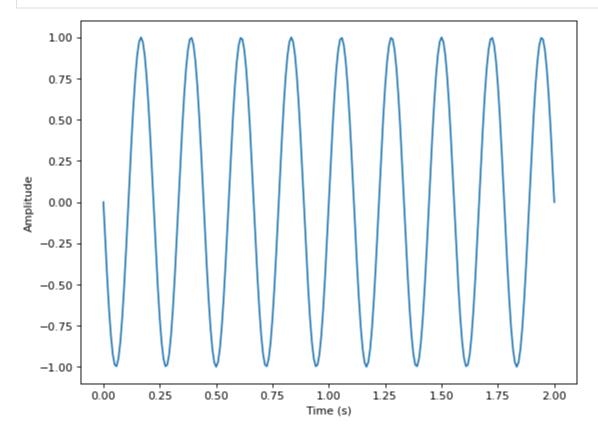

1a. sinewave

```
#testing
Alb_code.sinewave(0.0, f=5, d=0.05)
```

Out[]: 1.0

A quick graph:

```
t_120Hz = np.linspace(0,2,num=120*2+1) # 120Hz denotes sampling rate
Alb_code.plot_sinewave(t_120Hz, f=4.5, d= 1.0)
```

1)

Formula:

 $ext{time} imes f_s = i$

Unit Analysis:

$$seconds \times Hz = seconds \times \frac{samples}{second} = samples$$

2)

Formula:

$$-\mathrm{delay} imes f_s imes 2\pi = \mathrm{phase} = \phi$$

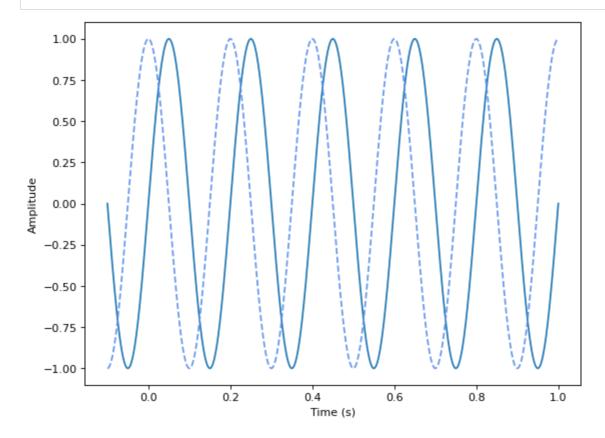

Unit Analysis:

$$\text{seconds} \times \frac{\text{cycles}}{\text{second}} \times \frac{\text{radians}}{\text{second}} = \text{radians}$$

Another quick graph:

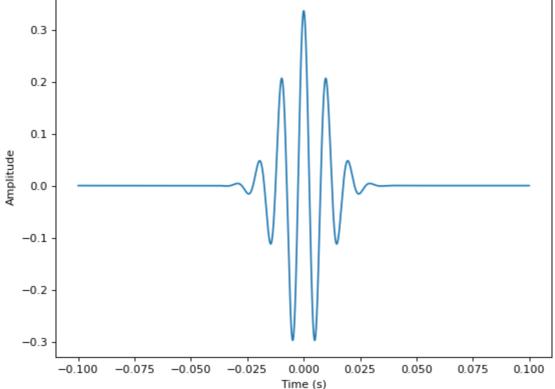

In []:

 $\label{eq:total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_total_$

1b. gabor

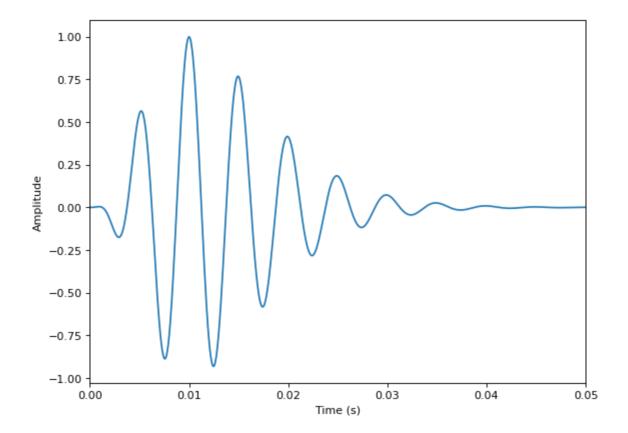

```
In [ ]:
         #testing
         A1b_code.gaboro(-3, f=0.0625, sigma=8)
        0.8611504148937256
Out[]:
In [ ]:
         # setting up the function's arguments
         fs = 1000 \#1000 Hz
         sigma = 1/100
         f = 100
         t = np.linspace(-.1, .1, num=2*1000*fs+1)
         norm = A1b_code.gabore_norm(fs=1000, sigma=sigma, f=f)
         # plotting the function
         A1b_code.plot_gabor(t, sigma=sigma,f=100, a=1/norm)
            0.3
            0.2
```

1c. gammatone

```
In []: #testing
   Alb_code.gammatone(0.01, f=100)
Out[]: 1.0
   A quick graph:
```

```
t_20000Hz = np.linspace(0,1,num=20000*1+1) # 20000Hz denotes sampling rate
A1b_code.plot_gammatone(t_20000Hz, f=200.0, xlim = (0.00, 0.05))
```

2. Simple computation

2a. localmaxima

```
# testing
print(A1b_code.localmaxima([1, 3, 2, -2, 2, 4, 8, 6]))
# should return the indices of the local maxima

[1, 6]
```

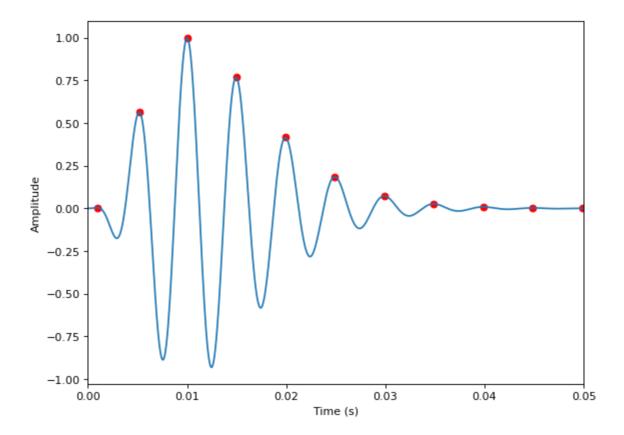

An illustrative graph:

```
In []: # First, setting up t for an old gammatone function:
    t_20000Hz = np.linspace(0,1,num=20000*1+1) # 20000Hz denotes sampling rate
    gammatone_vals = A1b_code.gammatone(t_20000Hz, f=200.0)

# then, getting the local maxima so I can graph them:

local_maxima_indices = A1b_code.localmaxima(gammatone_vals)
local_maxima_times = []
local_maxima_values = []
for index in local_maxima_indices:
    local_maxima_times.append(t_20000Hz[index])
    local_maxima_values.append(gammatone_vals[index])

A1b_code.plot_local_maxima(t=t_20000Hz, fn_vals=gammatone_vals,\
lm_t=local_maxima_times,lm_vals=local_maxima_values,\
xlim = (0.00, 0.05))
```

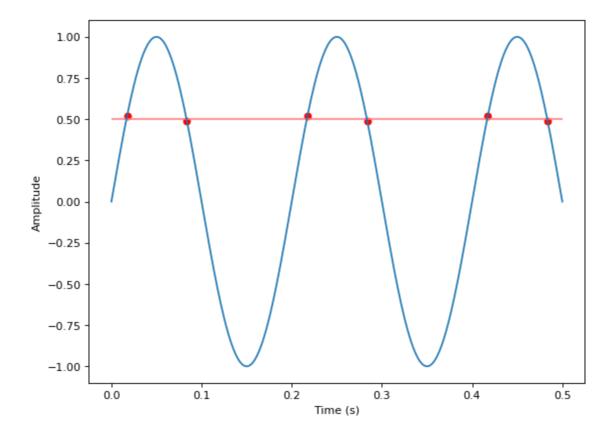

2b. crossings

A graph:

```
In []: # setting up a plottable function with a list of t values
    # and a list of sine values
    t_200Hz = np.linspace(0,0.5,num=200*2+1) # 200Hz denotes sampling rate
    sine_vals = Alb_code.sinewave(t_200Hz, f=5, d= 1.0)

# then, getting the crossing points so I can graph them
    crossings_indices = Alb_code.crossings(sine_vals, 0.5, dir="both")
    crossings_times = []
    crossings_vals = []
    for index in crossings_indices:
        crossings_times.append(t_200Hz[index])
        crossings_vals.append(sine_vals[index])

Alb_code.plot_crossings(t_200Hz, sine_vals, crossings_times,\
        crossings_vals, threshold=0.5)
```

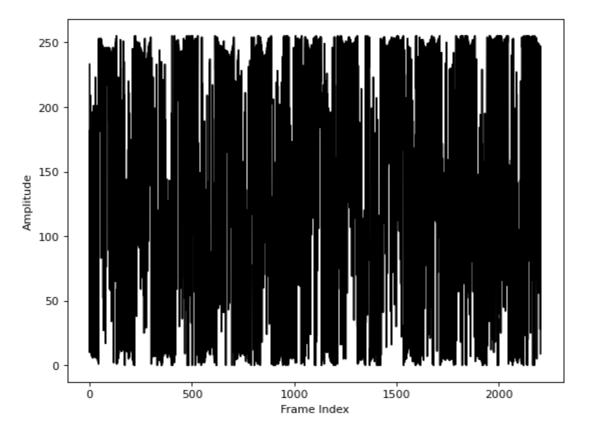

2c. envelope

```
#reading in the speech.wav file
speech = wave.open('speech.wav', mode='rb')
speech_data = speech.readframes(speech.getnframes())
speech_data = list(speech_data)
```

Plotting a segment of speech.wav

```
framerate = speech.getframerate()
  cut_speech_data = speech_data[round(3.0*framerate):round(3.1 * framerate)]
  Alb_code.plot_raw_audio(cut_speech_data)
```

Plotting the entire speech.wav with an envelope

y_lower, y_upper, block_indices = A1b_code.envelope(speech_data, 5000)
A1b_code.plot_envelope(y_lower, y_upper, block_indices)
